

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	A multimedia company experienced a Dos attack, which compromised the internal network for two hours. During the attack the network services suddenly stopped responding. The Cybersecurity team found out that the problem was a DDos attack through a flood of ICMP packets. The team responded by blocking the incoming ICMP packets.
Identify	A malicious actor had sent a flood of ICMP pings into the company's network through an unconfigured firewall.
Protect	The cybersecurity team implemented a new firewall rule to limit the rate of incoming ICMP packets. An IDS/IPS system to filter out some ICMP traffic based on suspicious characteristics
Detect	Source IP address verification on the firewall to check for spoofed IP addresses on incoming ICMP packets. Network monitoring software to detect abnormal traffic patterns
Respond	For future security incidents, the cybersecurity team will quickly isolate any affected systems to prevent the issue from spreading across the network. They will then focus on restoring critical systems and services to minimize business disruption. After that, the team will review network logs for any unusual or

	suspicious activity to determine the cause and impact of the incident. Finally, all incidents will be documented and reported to upper management and, when required, to the appropriate legal or regulatory authorities.
Recover	To recover from an ICMP flood DDoS attack, first restore network services so they return to normal operation. To help prevent similar attacks in the future, configure the firewall to block external ICMP flood traffic. During recovery, temporarily stop any non-essential services to reduce network load. Then, bring critical services back online first so important business functions can continue. Once the ICMP traffic has subsided and timed out, gradually restore the remaining non-critical systems and services.

Reflections/Notes:
